

D6, D10 and D4: older edition

These are the older main-page rules, NOT version 4.1 on [france.html](#) and [kazakhstan.html](#). A die result is not necessarily final output. One unit means that guild's product; only quality-approved Titans are shipments.

D6 production and actual output

D6 has faces 1-6, not 0. Rolls 1, 2 or 3 give base capacity 1, followed by D10. Rolls 4, 5 or 6 give base capacity 2, without an event roll. Actual output = minimum of usable capacity and every required input stock. Usable capacity = $\max(0, \text{base capacity} - \text{repair hours served} / 4)$, or 0 during a rework hold.

0 production = nothing is released. It is caused by missing inputs, repair time or a hold, not by a face 0. Example: D6 = 2 gives base 1, but immediate repair of 4h gives $\max(0, 1 - 4/4) = 0$. No complete input set means no production die, no event die and no fine.

1 production = one whole unit, not a half-finished unit. Examples: base 1 with a free fix and sufficient inputs; or base 2 but only one complete input set. A free fix does not restore the unit lost on a partial production roll.

2 production = two whole units. You need usable capacity 2, inputs for two units and no hold. Example: D6 = 5, no repair, 2 frames + 2 engines = 2 subassemblies. Scheduled repairs skip production and event dice: use base 2; 4h served leaves capacity 1, and 8h leaves 0. Inputs may further reduce output.

Dice and production: use the rules for the version you are playing.

D10 events: every face and when it applies

Roll D10 only after a partial production roll, D6 = 1-3; not just because final output is 1 or 0. Odd faces 1, 3, 5, 7, 9 mean Unknown cause: reroll until an applicable even face appears. Inapplicable results have no charge.

2 = Machine failure. 6 = Machine misalignment. Both apply to all guilds. Choose planned corrective action, next-round risk review or immediate quality hold.

4 = Defective part: only Subassembly, Final assembly and Inspection. Requires quality hold and an applicable D4. Shops 1-3 reroll this event.

8 = Defective raw material: only Shops 1-3 outside supplier protection. Follow the supplier occurrence/vote rule, not D4. Other guilds and protected shops reroll.

10 = Machine breakdown: all guilds, immediate quality hold; only D4 = 2 is valid. A physical D10 face 0 means 10; enter 10 in this older game. Example: D6 = 2 then D10 = 7 means reroll D10, not seven lost units. If the next D10 is 6, respond to misalignment.

Dice and production: use the rules for the version you are playing.

D4 remedies: every face, costs and repair timing

1 = Stop and investigate: 4 repair hours / 1 gold. Valid only for failure or misalignment (D10 = 2 or 6).

2 = Root cause analysis: 8 repair hours / 2 gold. Valid for any non-vendor incident (D10 = 2, 4, 6 or 10).

3 = Software / parts fix: 0 repair hours / 0 gold. Valid only for D10 = 2 or 6. Base capacity stays 1 after the partial production roll; a free fix does not raise it to 2.

4 = Rework: only for a defective part (D10 = 4). The detecting guild releases 0, retains its inputs and pays no additional repair fee. The origin pays 2 gold now and serves 8h from next round. At Subassembly, origin D6 = 1-3 assigns Shop 1 and 4-6 Shop 2; at Final assembly, 1-3 assigns Subassembly and 4-6 Shop 3. At Inspection, the origin is Final assembly without a die.

Reroll an inapplicable D4 without a charge and keep the chosen response. For remedies 1-3, pay now: quality hold serves repair immediately, planned corrective action next round; a 0h fix closes immediately. Example: partial base 1 plus an immediate 4h remedy gives 0 today, but the same planned remedy leaves capacity 1 today and uses 4h next round. Inputs and other constraints still apply.

Other older-edition D6 uses: deferred risk review 1-2 = 0h / 0 gold; 3-4 = 4h / 1 gold; 5-6 = 8h / 2 gold. An origin D6 assigns responsibility, not production. Follow the named roll on screen: production, analysis and origin are different uses of the same die.
